

PRESS RELEASE

New buffalo supplement ideal for dry winter months

A new supplement for buffalo, which can be applied effectively particularly during times of feed shortages, can help producers to see their game through the winter successfully this year.

Opti Game Buffalo is a custom-made supplement that was scientifically formulated with relatively more fibre and less proteins and is ideal for non-selective eaters, like buffalo. The product has been developed by Opti Feeds from Lichtenburg with the aim to let commercial game benefit from it and therefore give the game producer more profit in his pocket.

The supplement – which is also endorsed and used by the rare game breeder, Piet du Toit – contains grain products, processed grain products, vegetable protein, roughage products, oils and fats as well as vitamins and minerals and is available in meal or pelleted form. Opti Game Buffalo contains no urea or medicaments and is safe for use by all game.

Game producers can expect the following from Opti Game Buffalo:

- Increased calving or lambing percentage.
- Animals can begin breeding from a younger age.
- Herds increased faster – thus more excess animals can be sold.
- Increased general health and resistance to disease.
- Animals survive and perform during droughts.

Opti Game Buffalo is available in a 40 kg packaging and can be obtained at most retail stores that stock Opti Feeds products, including NWK Retail, Suidwes Agriculture and Hinterland.

ENDS.
